Plotraa handover: WhatsApp assistant fixes

For: Sant (review, merge, deploy) | From: Pankaj's session with Claude | Date: 19 Oct 2026

Branch: claude/gifted-dirac-onn0ay | Repo: plotra-backend | Base: main (after PRs #58 and #59)

This follow-up fixes the problems found while testing the Plotraa Assistant, voice notes and the payment flow. It changes code and knowledge text only: **no database migrations and no new environment variables**. Unit tests: 115 of 115 pass (`npm test`). Nothing here could be tested against real WhatsApp, OpenAI or the live database, so the phone checklist in section 5 matters.

1. What was fixed

#	Problem reported	Cause and fix	Main files
1	**Voice hallucination** (top priority): a silent or unclear voice note became the example sentence from the prompt.	The transcription prompt contained a full example listing, and the model read it back on silence. The example is removed (word list only). Any transcript that echoes the prompt, including the old sentence, is dropped, so the dealer gets the existing "couldn't make out the voice note" reply.	src/services/voiceNoteService.js
2	Asked why a listing is not live, the bot blamed the location pin.	The assistant now receives the listing's real status with a plain meaning (for example awaiting_approval = waiting for the dealer's "haan"). Knowledge text states the pin is optional and never blocks publishing.	src/services/assistantService.js, src/assistant/plotraaKnowledge.js
3	Seller messages in Hinglish ("bechni hai") got a buyer-search reply; the longer one with a price created no lead.	New first-person seller check runs before buyer search (both on the platform number and on a dealer's number). A selling message always becomes a seller lead (dealer lead on a dealer's number), with type, price and size filled from the text if the model missed them. "Plots for sale in Dugri" stays a buyer search.	src/utils/sellerIntent.js (new), src/controllers/webhookController.js, src/services/assistantService.js
4	Dealer-to-seller switch mid-signup mixed both replies; the first joining reply said "team will review" too early.	A selling message no longer gets the joining follow-up appended. The joining reply is now a short welcome; the system adds what is still needed and only says the request was sent for approval once name and area are both collected.	src/services/assistantService.js, src/assistant/plotraaKnowledge.js
5	Packages vs plans wording; empty package QR code.	Dealer-facing text now says "plan" everywhere. If a chosen plan has no QR, the agent is told honestly (no "shortly" promise) and the team gets a support request.	src/services/agentPaymentService.js, src/services/agentIntentService.js
6	Bot sometimes answered Hinglish in English.	Stronger Hinglish detection (a single "hai" in a long sentence used to read as English) and an explicit language line in the assistant prompt.	src/utils/replyLanguage.js, src/services/assistantService.js
7	Payment receipt flow from an unpaid test agent gave no reply on failure.	If saving the receipt photo fails, the agent now gets a "please resend" message and the team gets a support request.	src/controllers/agentPaymentController.js

2. Not fixed or needs action outside the code

Item	Status
Pin on the previews (639d4b..., ca571f..., a59490...) matches what you sent	**Not reproduced.** In code, a pin sent before or after the listing exists overrides the geocode, and the database columns keep full precision. Needs the real listings and the pins that were sent to investigate.
Meta template for reliable team alerts	**Needs someone in Meta.** Create and approve a utility template with 3 body variables, then set SUPPORT_ALERT_TEMPLATE_NAME (see HANDOVER_2026-10-18_SESSION.md section 4). The code now logs a clear warning when it is not set.
Email alert to the super admins	**Needs SMTP on the server.** The code already falls back to every super_admin; without SMTP_HOST the email is skipped and logged.
Packages and plans are still two tables	Wording is unified, but the assistant reads prices from *plans* and the WhatsApp menu from *packages*. Keep the names and prices identical, or merge them later.

3. Deploy

- Merge the PR, then on EC2: `git pull && npm ci && pm2 restart all --update-env`.
- No `npm run migrate` needed. No new env vars. Optional: set VOICE_TRANSCRIBE_MODEL=gpt-4o-transcribe if Punjabi quality is weak.
- Restart matters: the API and the agentIntake worker changed.

4. Behaviour you should know about

- A transcript that is only part of the prompt's word list is treated as silence, even if someone genuinely read those words aloud. Real speech that merely uses the same words is kept.
- The seller check is deliberately narrow (first-person selling verbs). An owner who writes only "Dugri kothi 1.5 crore" is still handled by the assistant's own judgement, not the safety net.
- On a dealer's own number a selling message becomes a lead in that dealer's inbox, not a Plotraa seller lead (unchanged rule).

5. Test on a real phone after deploy

- Send a silent or noise-only voice note: reply is "couldn't make out", never a property description.
- Send a real Punjabi voice note with property details: listing flow continues as before.
- From a new number: "meri Dugri wali kothi bechni hai 1.5 crore" gives a seller reply (not listings) and a row in Admin > Seller Leads.
- Start joining ("main dealer hoon"), then say "meri kothi bechni hai": only the seller reply, no joining follow-up.
- "main dealer hoon, judna hai": welcome line plus the question for name and area, and no "team will review" until both are given.
- As an agent with a listing waiting: "listing live kyun nahi hui?" explains it is waiting for your "haan" and does not mention the pin.
- Hinglish messages get Hinglish replies; plain English gets English.
- Choose a plan that has no QR: honest message, and a support request plus team alert appear.

- Send a receipt while storage is misconfigured (or temporarily break S3): agent gets the resend message and a support request appears.

6. Tests added

voiceNoteService: prompt has no example sentence; echoed example and word list are dropped; real speech with the same words is kept. assistantService: seller intent (selling vs buying wording), Hinglish detection, and that listing-status meanings never blame the pin.
